How to print your cards

6S SUCCESS · ONE PAGE, THEN YOU CAN THROW THIS AWAY

The cards are laid out nine to a US Letter sheet at 2.5 by 3.5 inches, the same size as a standard trading card, so they fit a card sleeve and a deck box and they shuffle together with any other 6S deck.

The one setting that matters

In your print dialog, set scaling to **100%**, **Actual size** or **None**. Do not use *Fit to page* or *Shrink oversized pages*. Those shrink the sheet by a few percent, which is invisible until you try to sleeve a card and it no longer fits.

Then

1. Paper size US Letter, portrait.
2. Margins: minimum, or borderless if your printer offers it. The card grid uses nearly the whole sheet.
3. Color if you have it. The colored bar across the top of each card is how you tell the six steps apart at a glance. Greyscale still works: the step name is printed on every card.
4. Card stock if you have it, around 65 to 110 lb cover. Plain paper is fine and the cards still work, they are just floppier.

Cutting

Cut along the thin border that outlines each card. The cards sit edge to edge, so one straight cut separates two at once: two vertical and two horizontal cuts finish a sheet. A guillotine trimmer is straighter than scissors and much faster.

> **If the bottom row prints short.** A few printers reserve more of the bottom edge than the sheet allows for. If that happens, print with borderless enabled, or print the same file from a different application. Do not fix it by scaling down, because that changes the card size.

Using them

Work one card at a time, in order, and finish the card before you pick up the next one. The order is the method: sorting after you have arranged things means arranging things you were about to remove, and a standard written before the clean describes a room that no longer exists.

Each pack ends with its standards sheet. That page is not a card. Print it on plain paper and post it where the room is, because a standard filed in a drawer is not a standard.
